

Accessibility Guidelines

Designing inclusive experiences for every user, regardless of ability or technology.

02 Principles

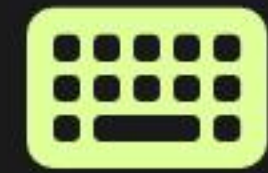

The foundational pillars of the Web Content Accessibility Guidelines (WCAG).

POUR Principles Overview

Perceivable

Information and interface components must be presentable to users in ways they can recognize.

Operable

Interface components and navigation must be usable with a keyboard and various input methods.

Understandable

Users must be able to understand the information as well as the operation of the interface.

Robust

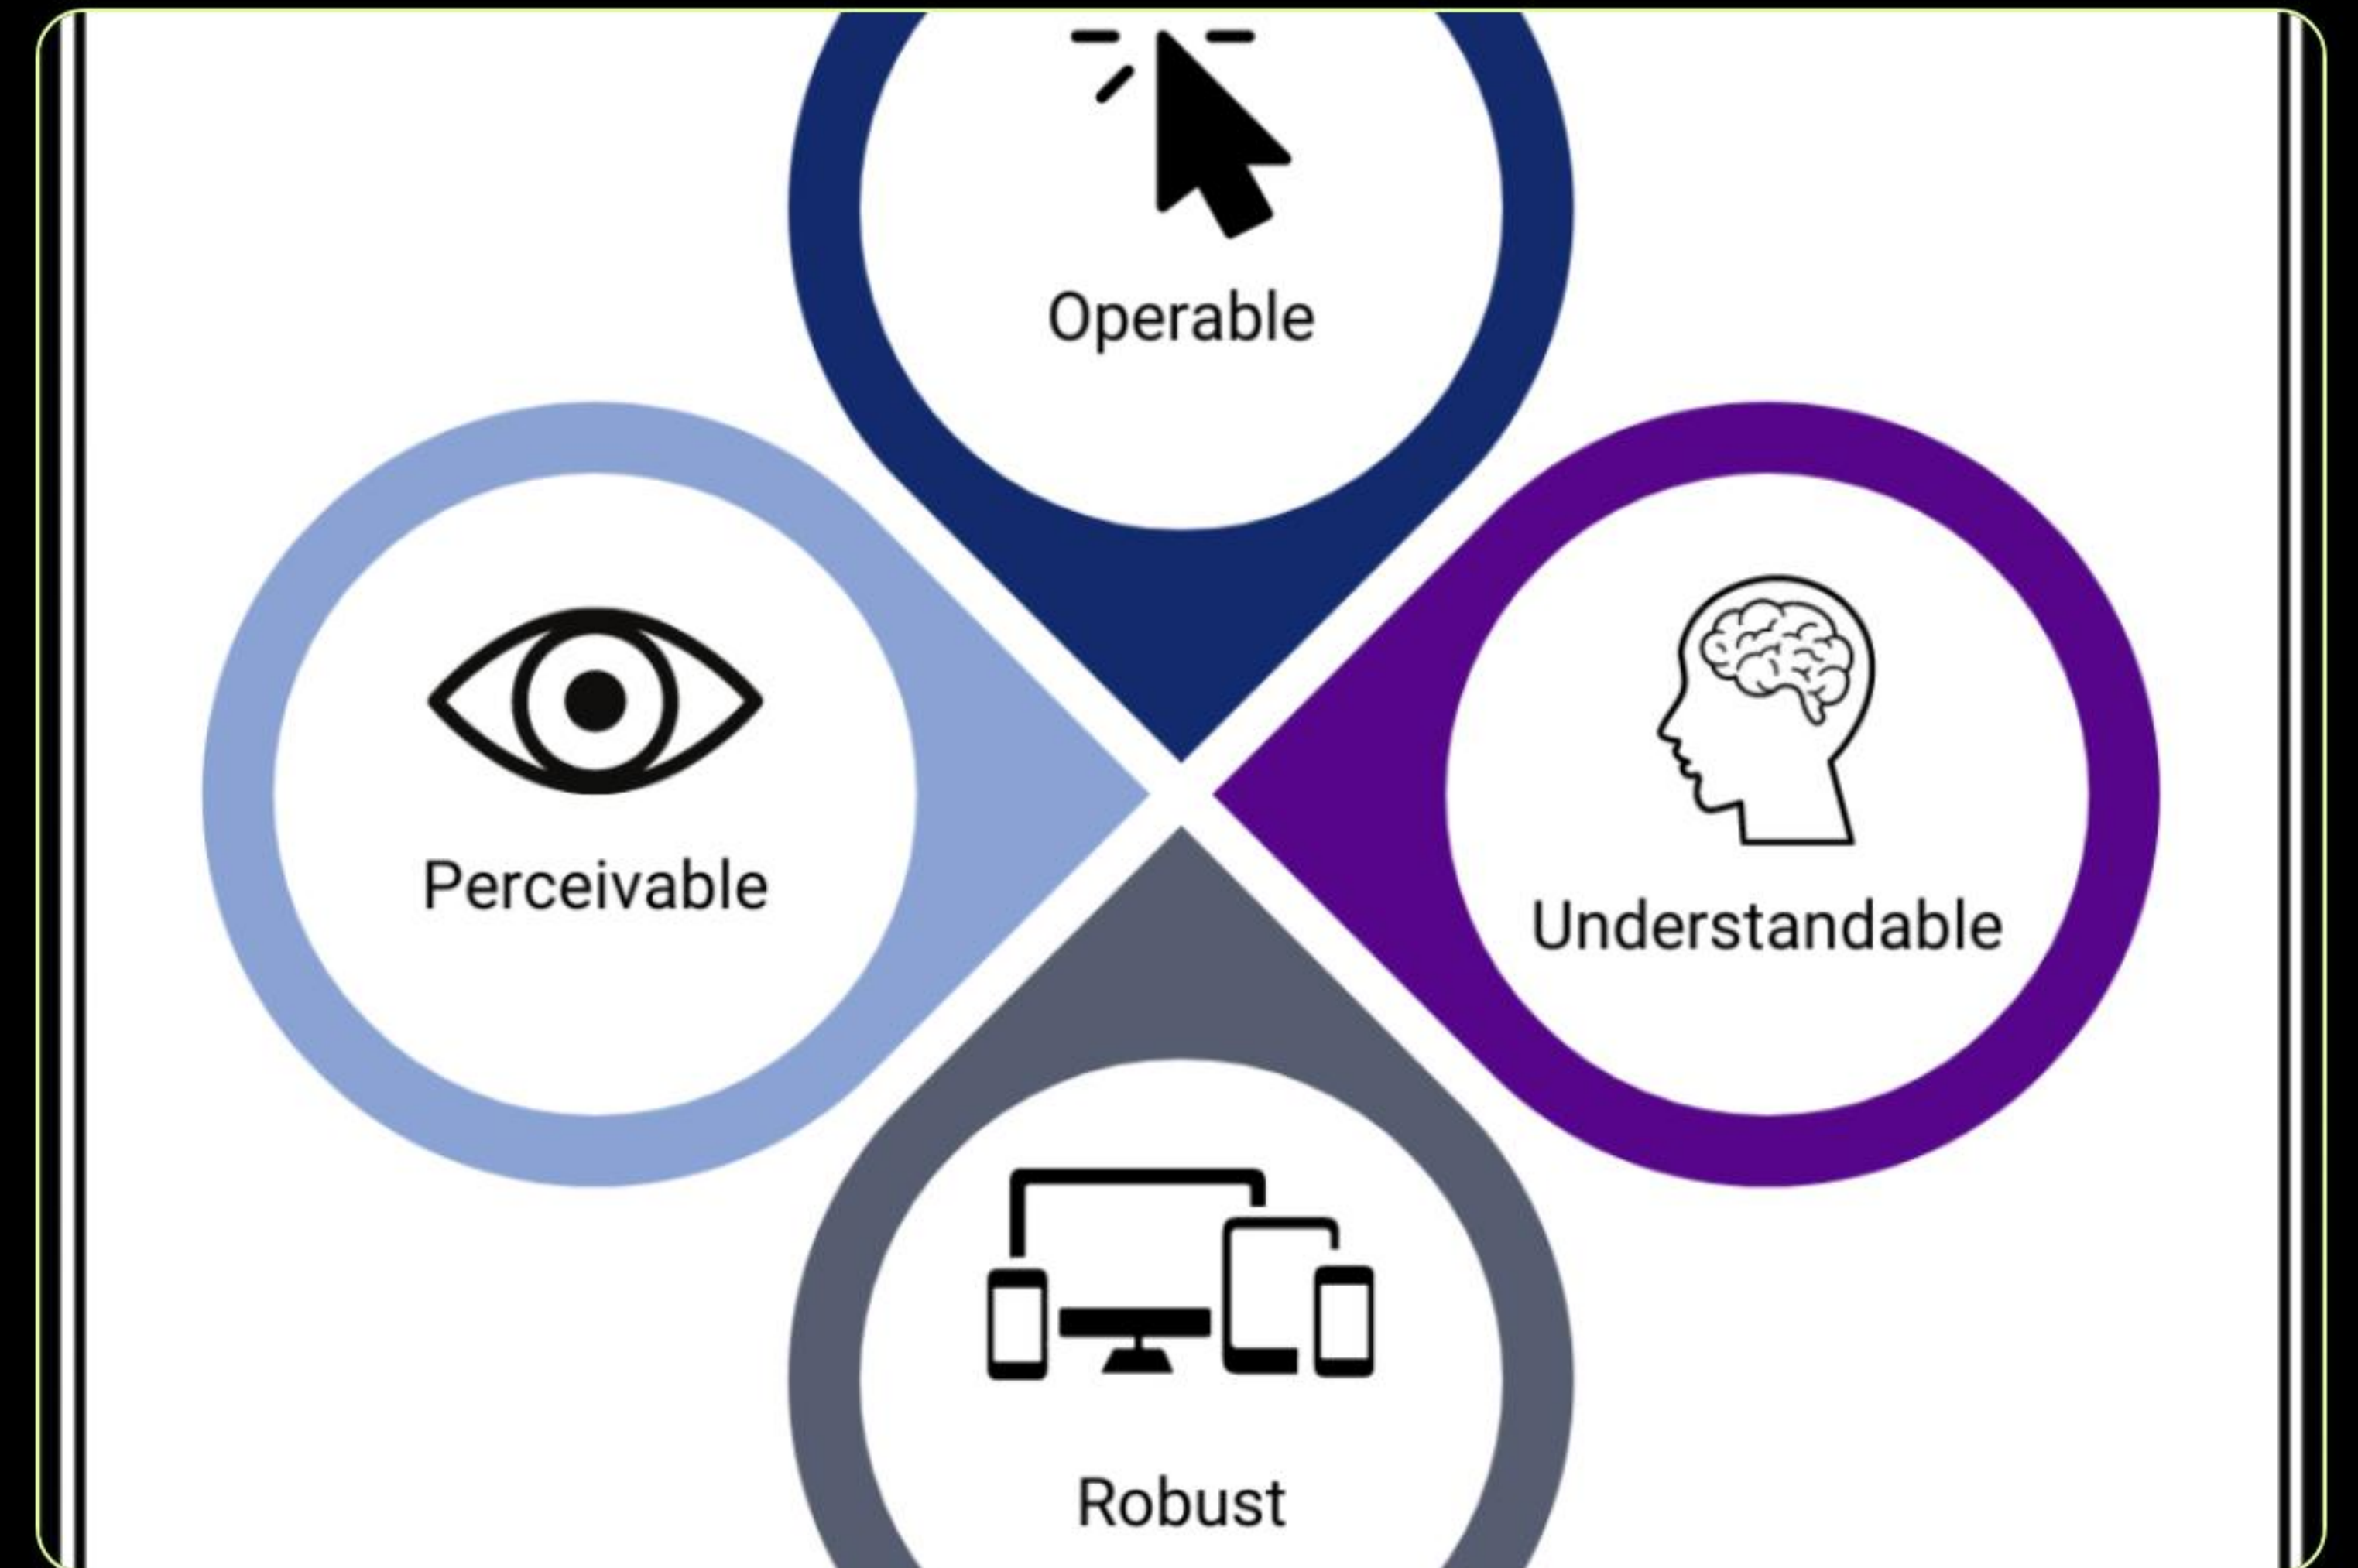

Content must be reliable enough to be interpreted by a wide variety of assistive technologies.

Principle 1: **Perceivable**

Sensory Diversity

Content should not rely on a single sense. Ensure all users can perceive information through:

- ✓ **Alt Text:** Descriptions for non-text content.
- ✓ **High Contrast:** Minimum ratio of 4.5:1.
- ✓ **Captions:** Alternatives for time-based media.

Principle 2: Operable

Interaction Control

Users must be able to navigate and use the site using only their keyboard or assistive device.

-  No keyboard traps allowed.
-  Provide enough time for actions.
-  Help users find and navigate content.

03 Navigation

Ensuring predictable, efficient, and logical paths through digital content.

Logical Focus Order

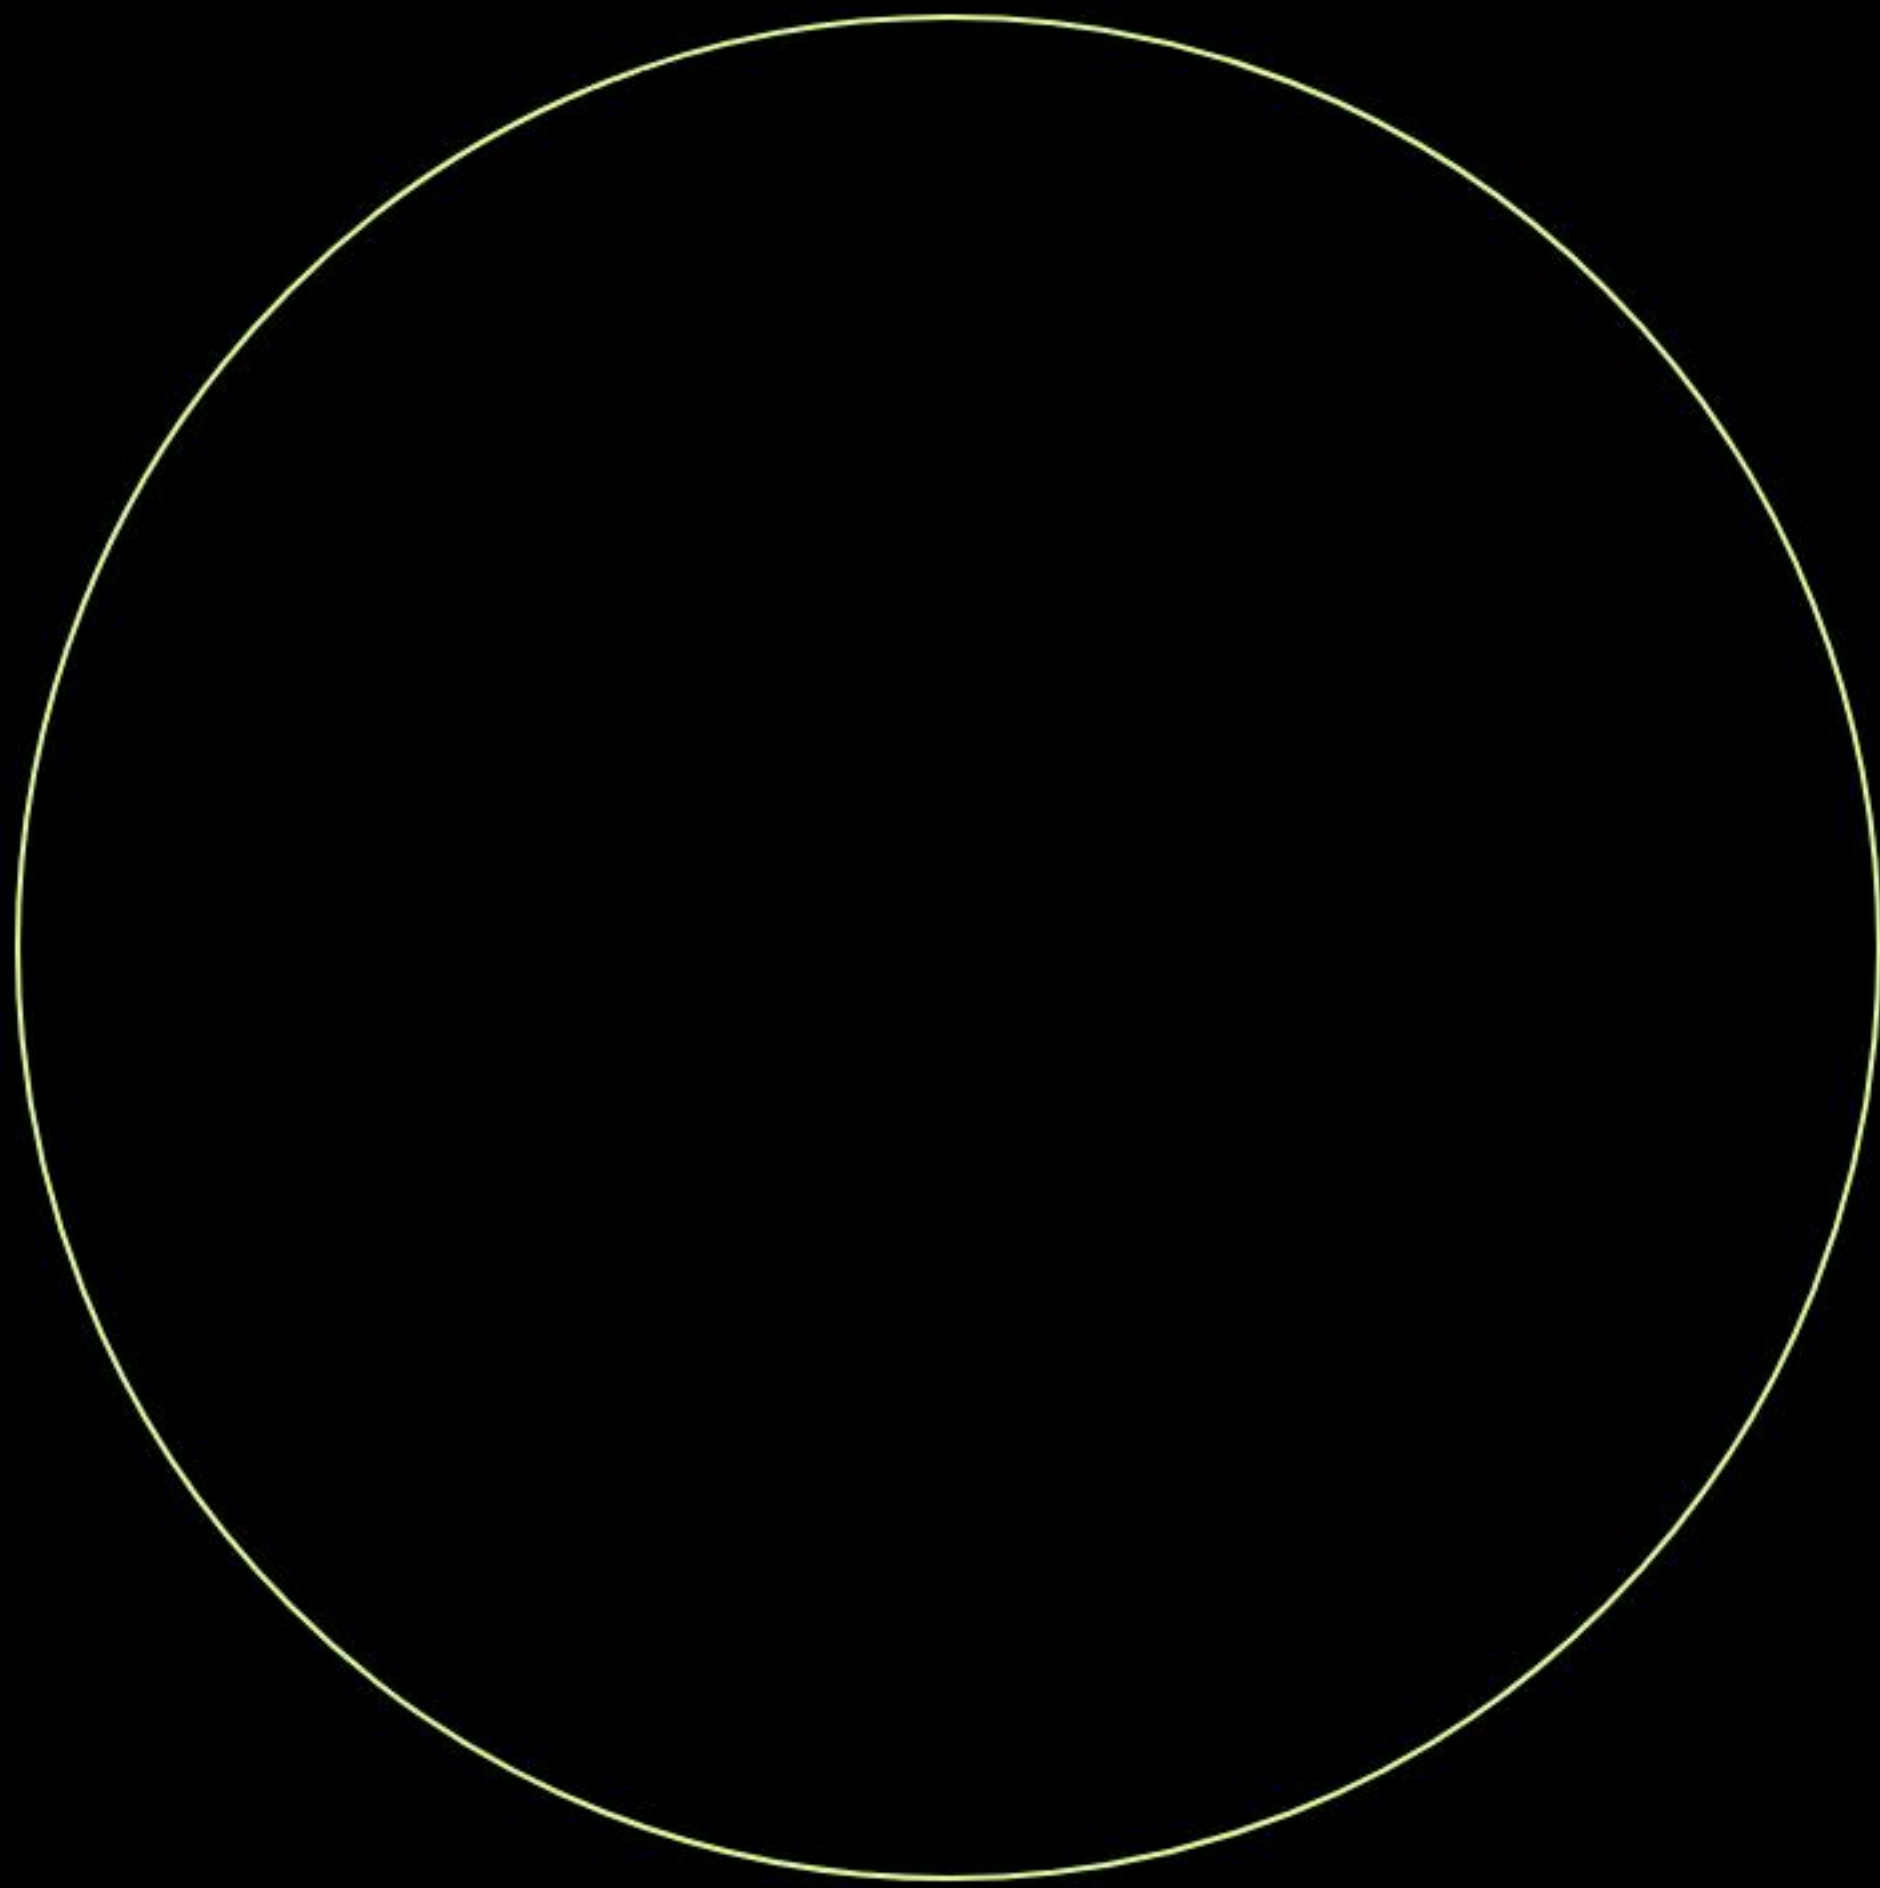

DOM vs Visual Order

The sequence in which elements receive focus must follow the document's logical structure. Avoid using absolute positioning to move elements away from their source code order.

Predictable Traversal

Standard navigation follows a left-to-right, top-to-bottom flow. Ensure that tab order mirrors the visual layout to prevent user confusion.

Visible Focus Indicators

The Focus Ring

Keyboard users rely on a visual indicator to know where they are. Never remove the focus ring unless you provide a superior, high-contrast custom alternative.

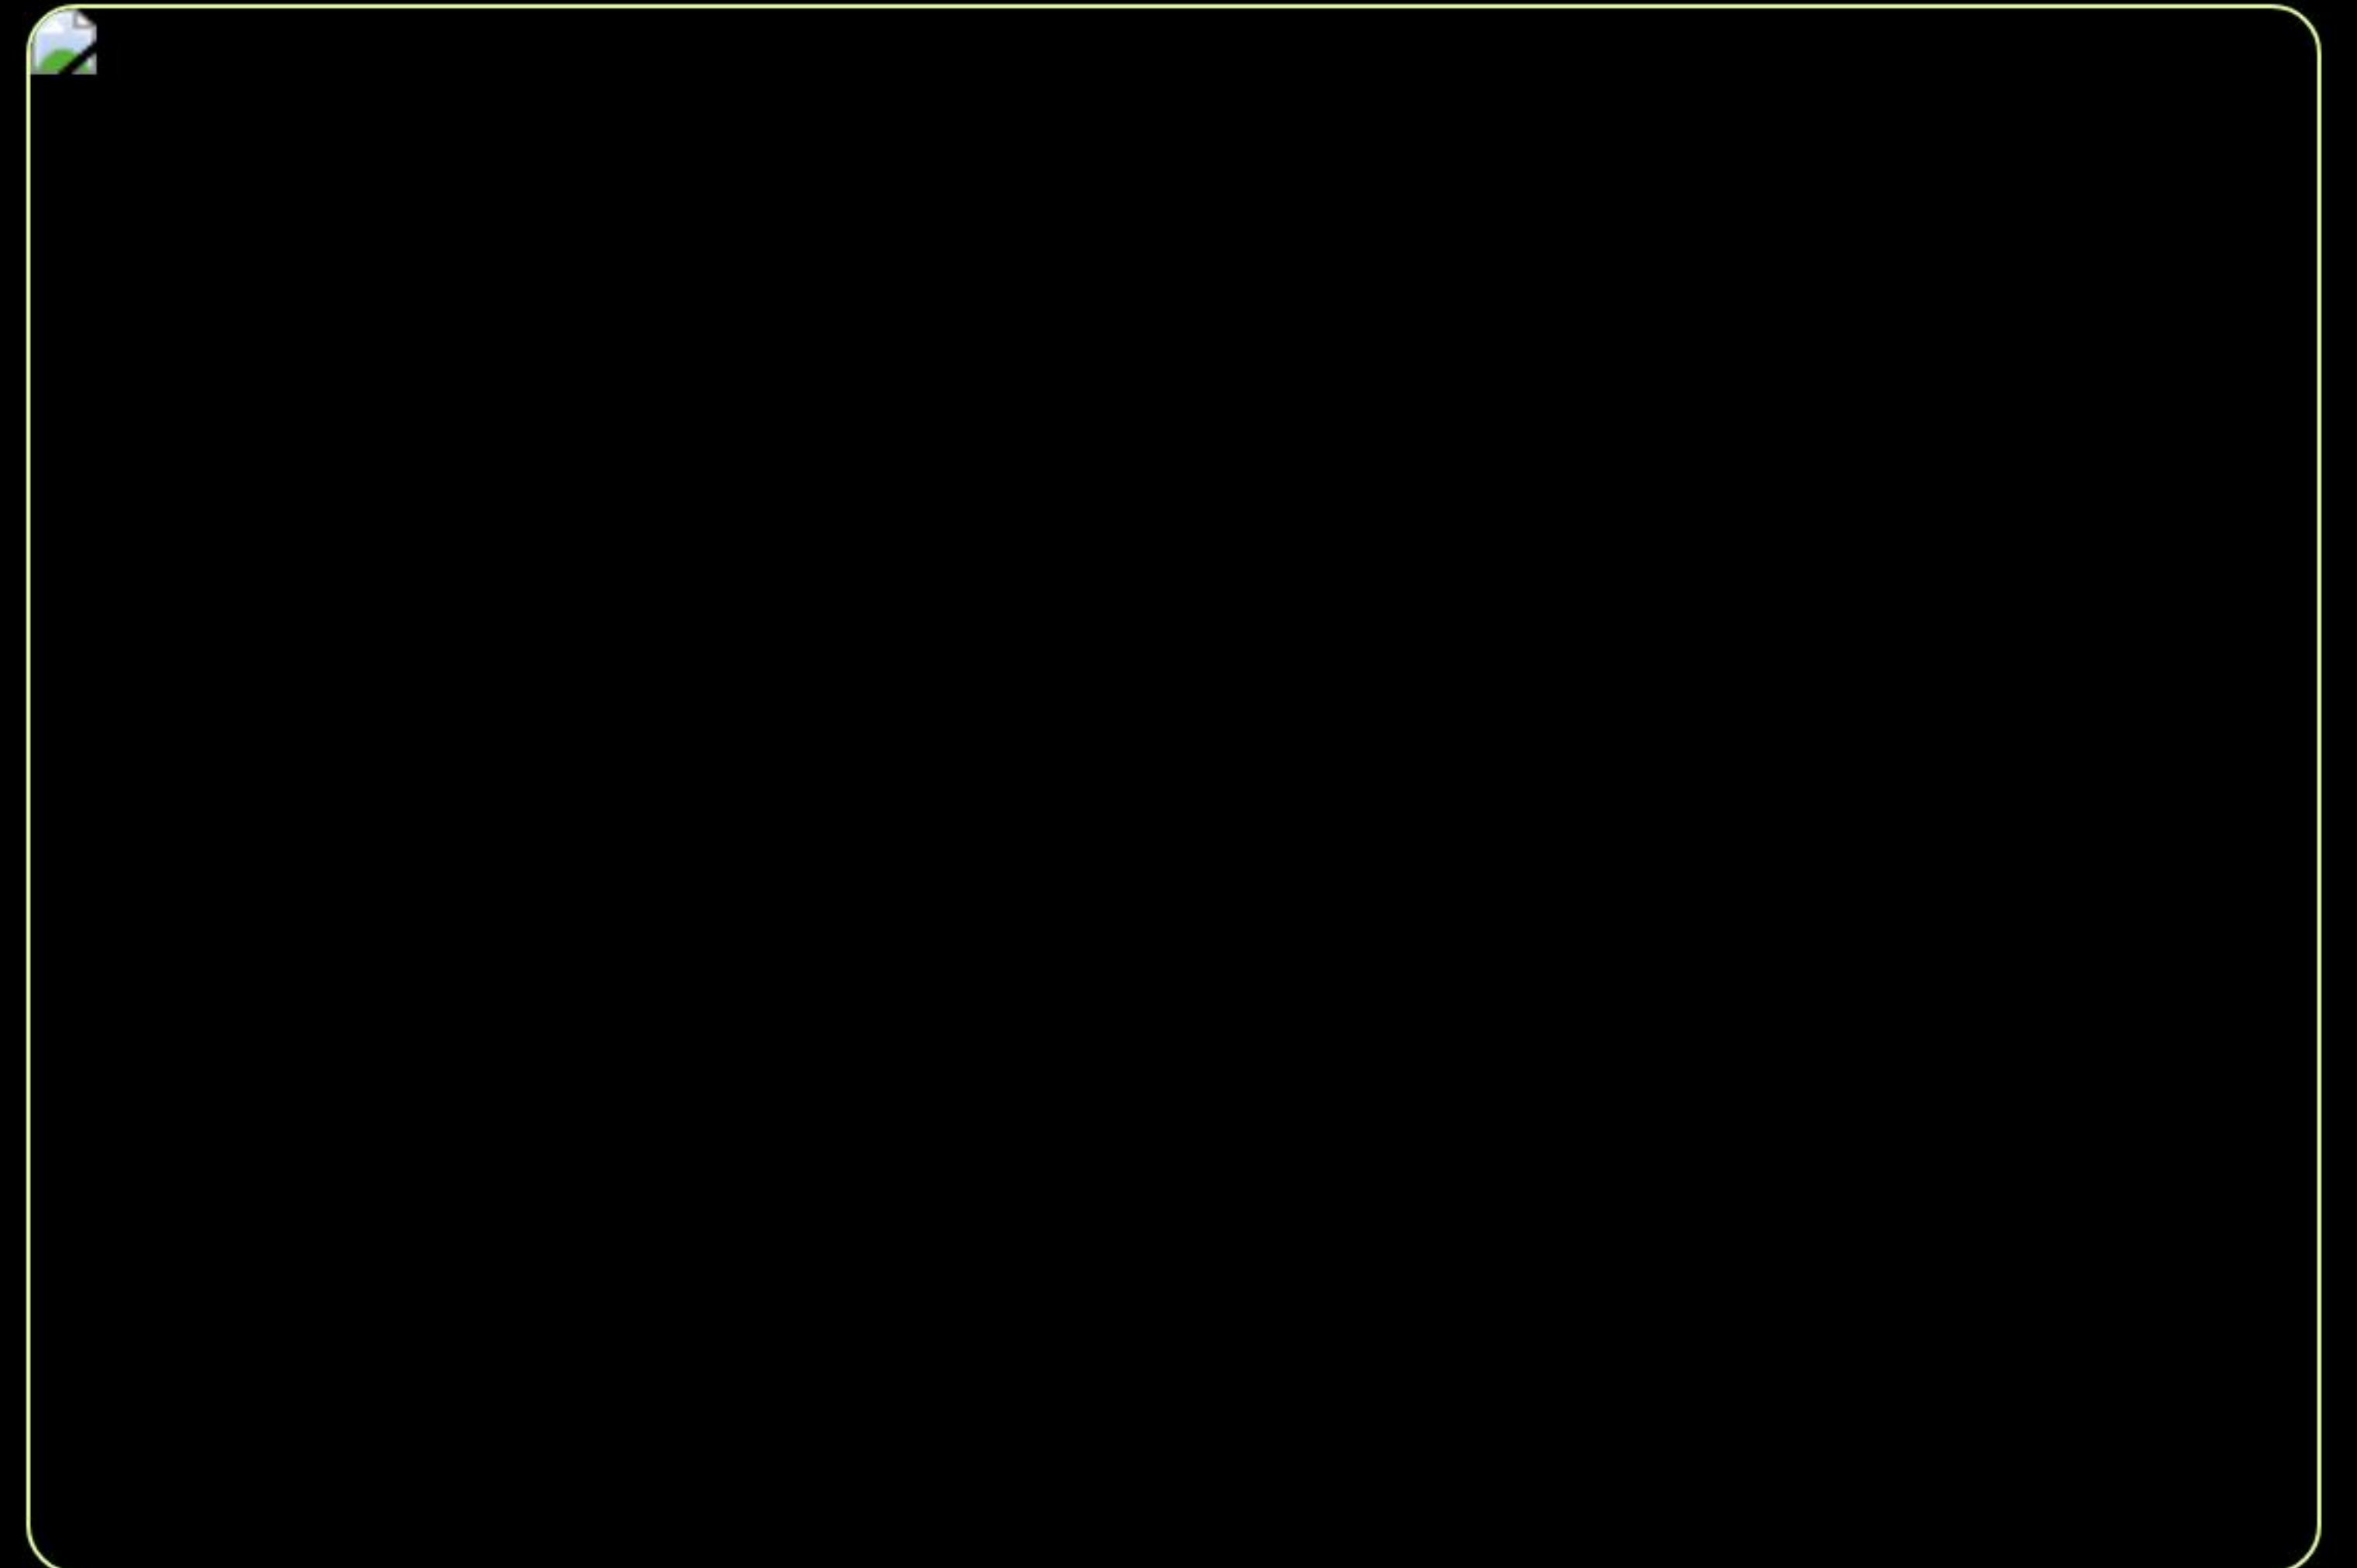

Focus indicators should meet a contrast ratio of at least 3:1 against the background and the element's non-focused state.

Skip Navigation Links

Efficiency for Users

Skip links allow users to bypass repetitive content like global headers and reach the main content instantly.

- ↓ Hidden until focused by Tab key.
- ★ Placed as the very first focusable element.
- 🔗 Links directly to the main ID.

Standard Keyboard Commands

Action

Keyboard Input

Landmarks & Structure

H Heading Hierarchy: Use H1–H6 in order. Never skip levels to ensure screen readers can navigate effectively.

📍 ARIA Landmarks: Define areas like `main`, `header`, `footer`, and `nav` for quick jumping.

☰ Predictable Menus: Keep navigation lists consistent across all pages to reduce cognitive load.

🏷️ Descriptive Labels: Every interactive element needs a name. Use `labels`, `aria-label`, or `aria-labelledby`.

Questions?

Thank you for prioritizing digital accessibility.
